Using the internet to support our clients in managing their mental health symptoms

Anne Vagi, Ph.D., C.Psych.
Summerville Family Health Team

10th National Conference on Collaborative Mental Health Care
May 29, 2009 - Hamilton, Ontario

How can the Internet increase our effectiveness?

- We can access information that is:
  - Evidence-based
  - Free
  - Accessible
  - In a user-friendly format
  - Developed by someone else
  - One component of effective treatment

Online treatments can provide professionals with:

- Up-to-date knowledge about our practice areas
- Information about a treatment or condition outside your scope of service
- Handouts or tools that can be integrated into existing therapy
- Tools that we can use to support our own mental health

May 29, 2009 avagi@summervillefht.com
Online treatments can provide clients with:

- A course of treatment for a specific condition
- Tools and information to supplement or replace face-to-face therapy
- Resources for booster sessions or relapse prevention
- Information in other languages

The clinician’s role in using self-help material

- We need to present ourselves as knowledgeable about the diagnosis or symptoms the client is wanting to manage.
- Many of our clients are seeking their own information about their conditions, and we can help them find the best available sources.

The clinician’s role in using self-help material (cont.)

- The web gives us access to high-quality information that we can learn from and in turn "sell" to our clients as valid and effective.
- We can support, monitor, and evaluate our client’s progress in working through a self-management program.
Using the web as a tool in Supported Self-Management

- The client is given guidance and support in finding and using self-help material.
- The therapist offers support by checking in with the client to encourage ongoing practice, offer troubleshooting, and provide accountability.
- The responsibility for using the material rests with the client.

Helpful components of supported self-management

- Client and therapist work collaboratively to empower the client to work on his/her own recovery.
- Self-management is one component of stepped care, which involves providing the right intensity of intervention at the right time.

Successfully Supporting Self-Management

- Therapist’s role is to provide tools and model their use in order to increase client’s skills.
- Regular and ongoing support has been associated with improved outcomes. Support can be in person or by phone.
